Resume

GIBEOM KO

Date of Birth 2003. 07. 16

Experience **10 Years**

Education - Graduated Susung High School

- Dongguk University - B.S. in Electronic & Electrical Engineering
  Completed sophomore year; currently on leave

Active - 2026 Cohort of Apple Developer Academy @ POSTECH

Contact kogibeom12@gmail.com

010-2493-4796

Career

2019 ~ 재직 중	Freelance Visual Designer & Developer
2023	Math Academy Teaching Assistant & Planned and developed an academy management solution

Awards

2026	**Excellence Award**, Daejeon Social Problem-Solving Ideathon
2025	**Impact Award**, Prography Profitlab Hackathon
2025	APEX Creative Problem-Solving Project, Dongguk University
2025	**Team Lead**, AirSquare Startup Club, Dongguk University
2024	**Top 50**, Defense Startup Competition
2024	**Creativity Award**, ROKAF Startup Competition
2023	**Grand Prize**, Dongguk University LINC+ IoT Hackathon
2023	**Excellence Award**, Starterthon, Dongguk University Startup Education Center
2022	**Excellence Award**, Dongguk University MARU Making Camp

Tools

- Ai — **80%** illustration
- Ps — **65%** Photoshop
- Figma — **80%** Figma

Selected Projects

UrbanEase 2025

Expanded the 2022 Ttota Subway boarding-assistance concept into a city-connected public transportation service designed with barrier-free mobility in mind.

CareBridge 2025

Designed an accessible healthcare solution that helps vulnerable users, including older adults living alone, find and use medical services more easily.

medISON 2024

Designed an age-inclusive medication search experience using image recognition and generative AI.

Speed Parking 2023

Designed an AI-assisted parking allocation concept that reduces the difficulty of finding available spaces and recommends spots based on user preferences.

Subway Board Assistance 2022

Designed an automated safety platform to prevent gap-related boarding accidents and support passengers with reduced mobility.

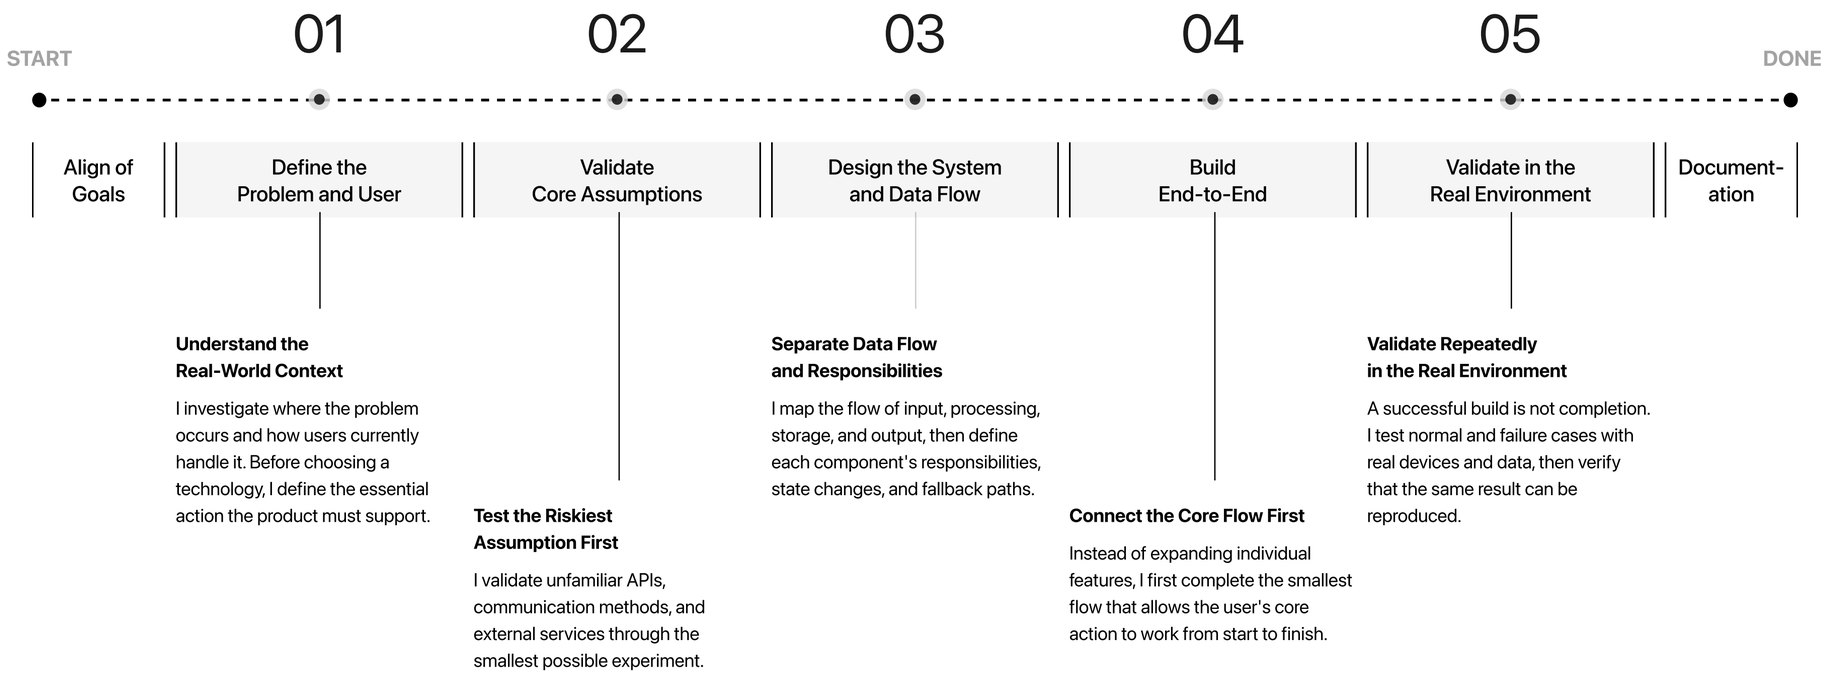

Social Program for Elders 2022

Conceptualized a social discovery service that helps older adults living alone find companions and reduce social isolation.

Work Process

Introduction

I define the problem, then test the riskiest technical assumption first.
I design the data flow, connect the core functionality End-to-End, and verify that the result is reproducible in a real environment.

Project Type
Product Engineering

Mobile & System Engineering

I structure incomplete user input into verifiable outcomes.

I connect mobile apps, AI, data, and hardware into one coherent user flow, then validate feasibility through working prototypes.

2025	AI-Assisted Early Disease Detection Service [CareBridge]
2024	Intelligent Medication Recognition Service [medISON]
2023	AI Parking Management Service [Speed Parking]

2023 - 2025

Projects 3

Focus **Product, Software**

Project
01

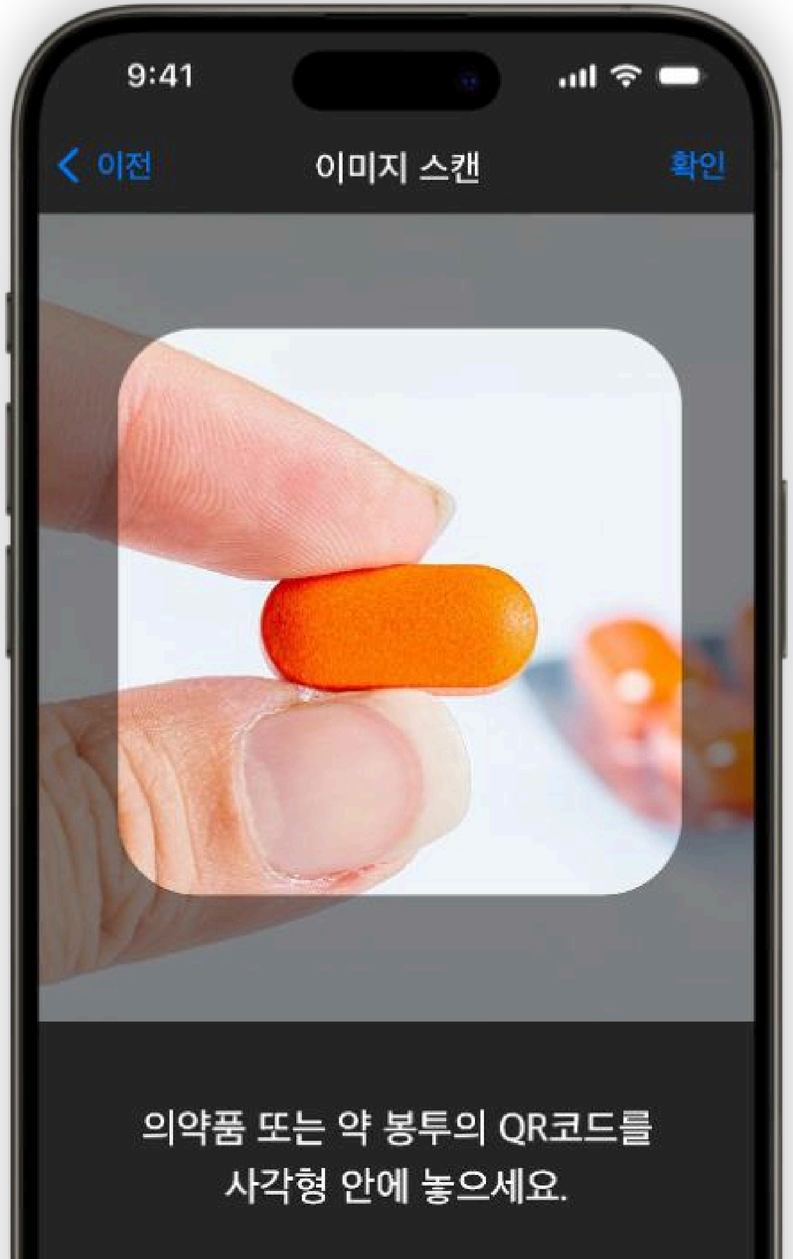

2026

An Intellgent Medi-Search Service using Image Recognition and Gen-AI

medISON

Designed a service that lets users identify unfamiliar medication through images, QR codes, or natural-language questions and share recent medication records in emergencies.

Team	이음 / Start-Up
Role	Team Lead · Product & Software
Work	2023.12 - 2024.08 (9 months)
Tech	OCR · Image Recognition · GPT-4o · QR · Mobile Prototype

Background

Medication information exists in public databases and on prescription bags, but users often do not know the exact product name when they need to identify a pill. The clues available to them may be limited to the pill's color, shape, imprint, a QR code, or an incomplete memory.

Problem

❶ Search Requires the Exact Drug Name

Most medication search services assume that users already know the product or ingredient name. When the pill itself is unknown, users do not know where to begin.

❷ User Clues Do Not Match the Search Interface

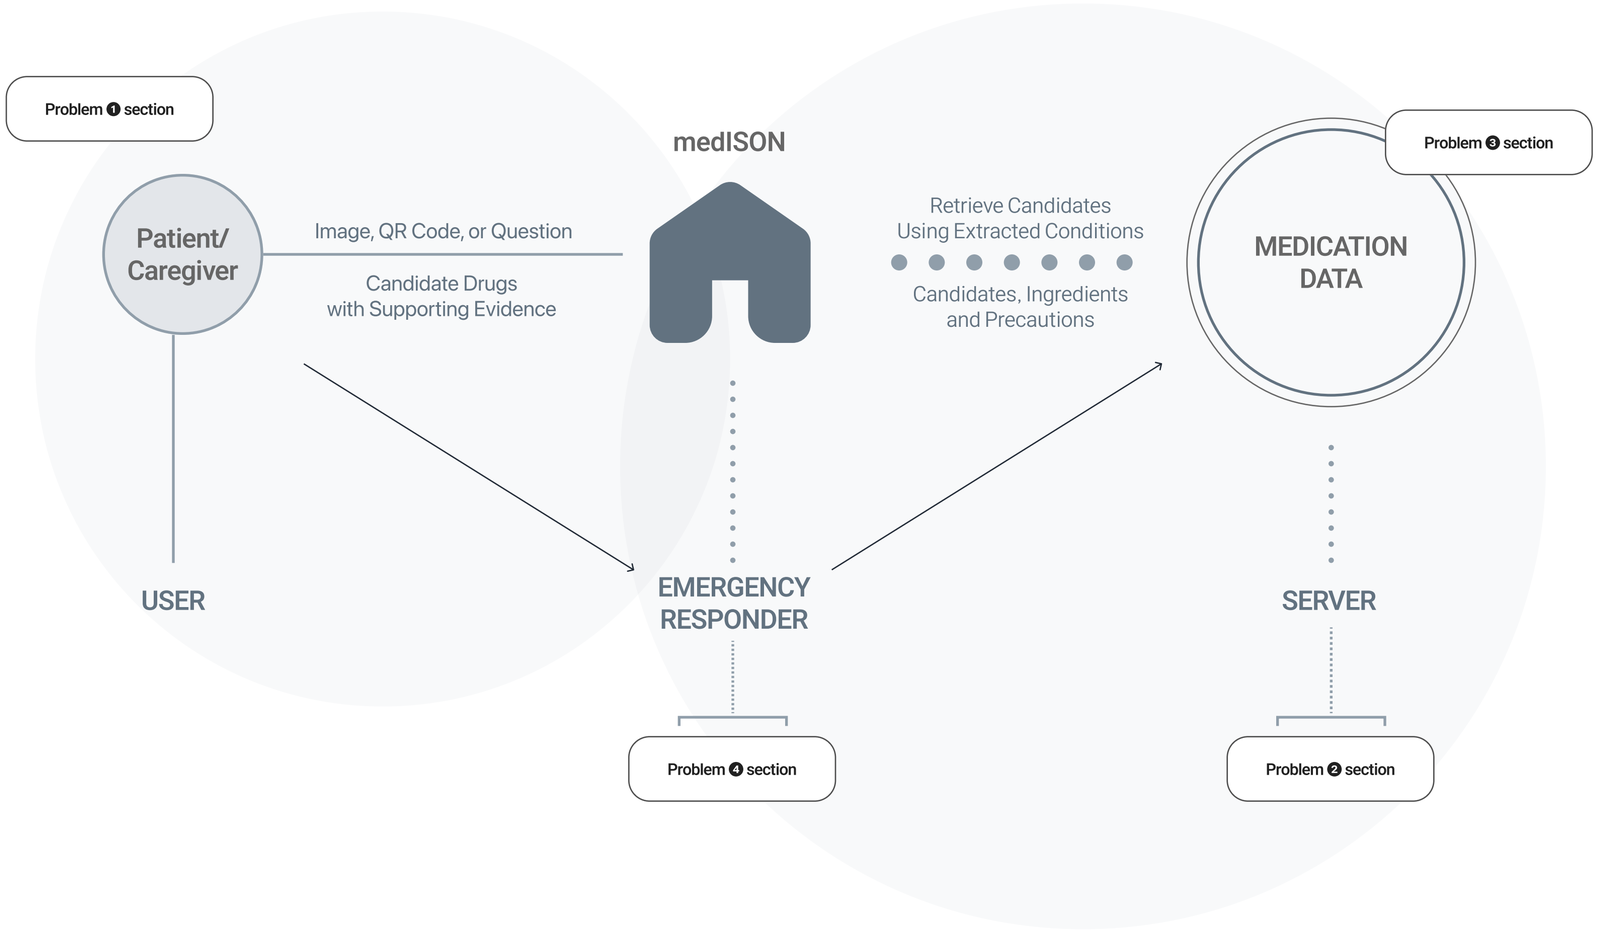

Users may have a pill image, color, shape, imprint, or prescription QR code. A single text search field cannot effectively use these different forms of input.

❸ The Boundary Between Candidates and Confirmed Information Is Unclear

Many pills look alike. Identifying a specific drug from one image can lead to misidentification, so the service must present candidates and ask the user to confirm.

❹ Medication Context Is Lost in Emergencies

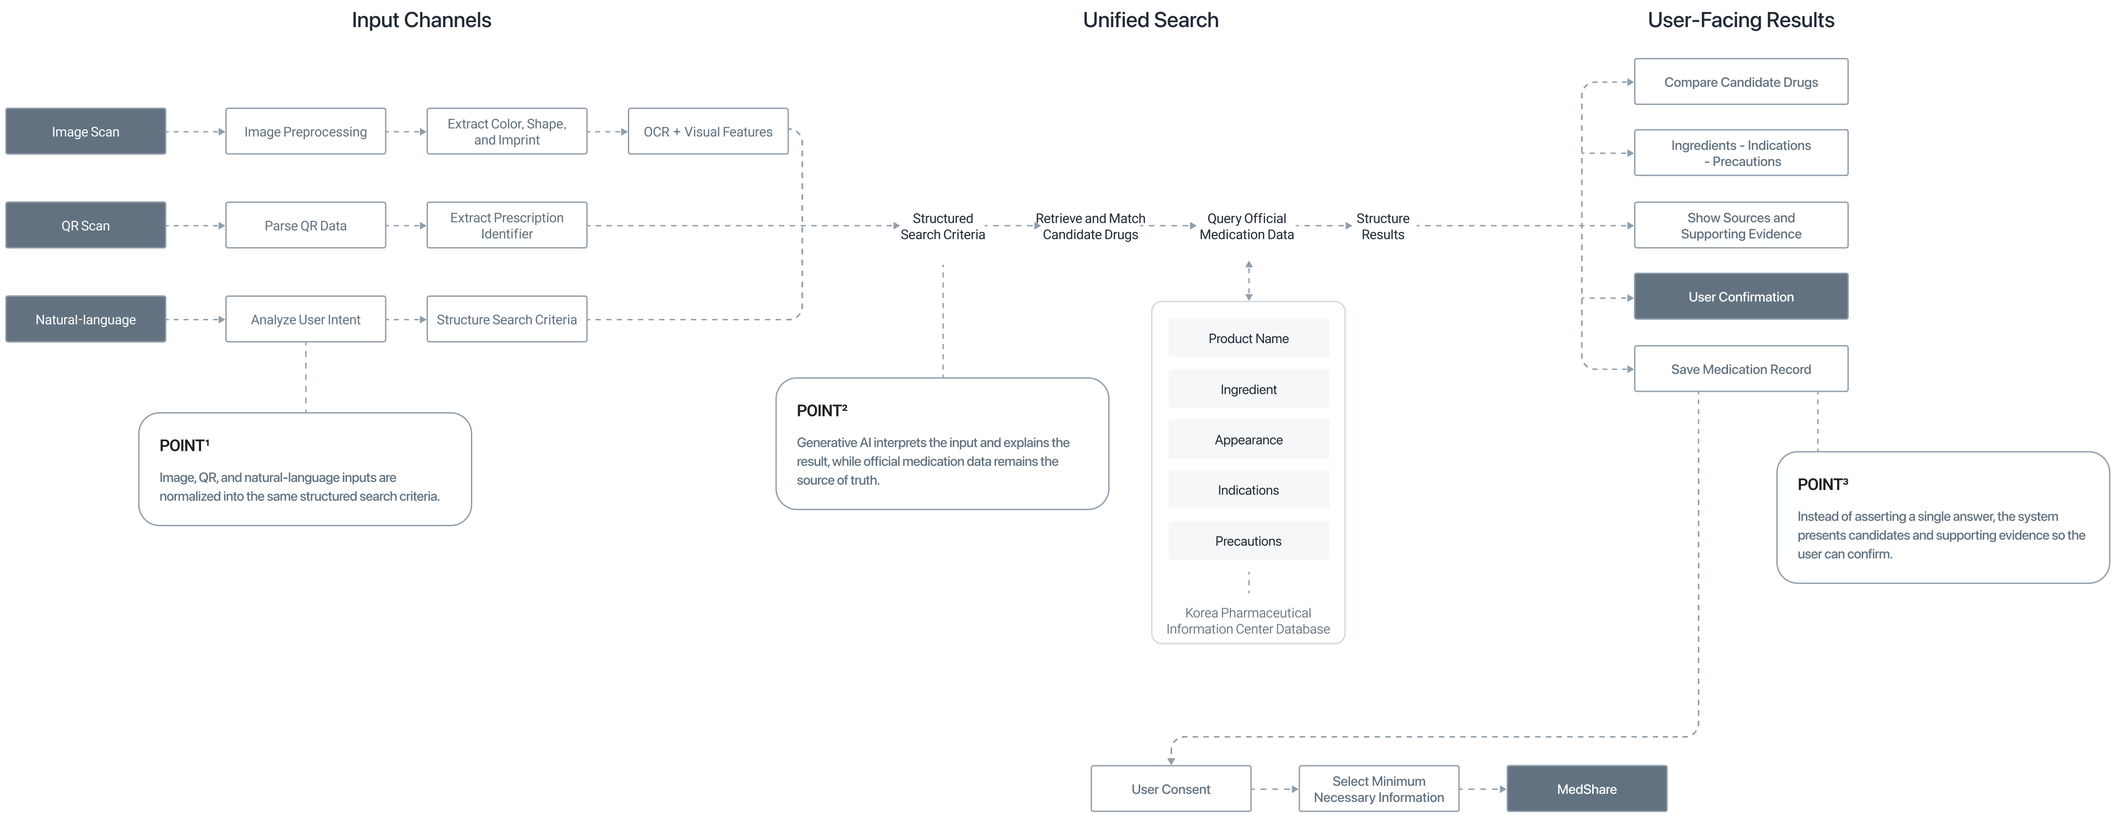

When a patient is unconscious or unable to explain their condition, it is difficult to communicate recent medications and basic health information immediately.

Solution

We Unified Different Inputs into **One Medication Search Flow**

▸ Medication Search Pipeline

Journey Map

Persona

Age — Mid-20s to early 40s

Status — Urban residents currently taking one or more prescription medications

Need
- An intuitive and practical experience
- Smart search with minimal manual input
- Easy access to current medication information

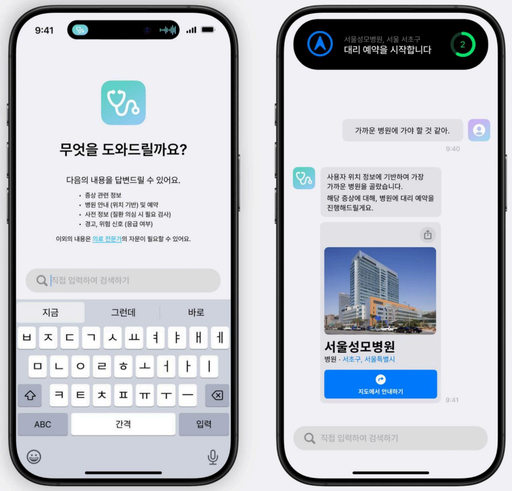

The journey map helped us understand the experiences and emotions users encounter throughout the service. We identified friction points and translated them into concrete product improvements.

Stage	01 Awareness	02 Search	03 Evaluation	04 Purchase	05 Use and Retention	06 Share and Feedback
Actions	Sees an advertisement while browsing social media or the web	Tries multiple ways to find medication information	Tests the free search feature and evaluates its usefulness	Decides to use the service and purchases or subscribes	Uses the paid features regularly	Shares the service with others and encourages them to try it
Think	"I want to identify this unfamiliar pill right now"	"Entering every pill characteristic manually is frustrating." "How much and when was I supposed to take this?"	"Can one photo really identify this pill?" "Is there a service that lets me search by photo?"	"Will the search work reliably?" "Searching is useful, but how should I take this medicine?"	"Should I keep using this service?" "Is the information useful and easy to understand?"	"I should leave a review and earn points." "This service is genuinely convenient."
Touch Points	Instagram, Facebook	Chrome	Search Similar-App Review	Purchase and Payment	Installation Guide / Customer Support	Instagram, Facebook
Emotions	**Desire** to find the information immediately	**Expectation** of a fast, accurate search **Concern** about making the wrong choice	**Concern** about inaccurate information **Satisfaction** from discovering new information	**Difficulty** choosing among several options **Concern** that inaccurate information could cause harm	**Satisfaction** with a convenient service **Frustration** if the product is difficult to use	**Enjoyment** from sharing feedback **Pride** in recommending a useful product
Needs	• Benefit-led messaging • Easily accessible Info	• Trustworthy information • Useful content	• Detailed information • Easy access to the core feature	• Fast, intuitive search • Clearly cited trusted sources	• A clear user guide • Accessible customer support	• Easy sharing • Incentives for reviews

Project 02

CareBridge

CareBridge

ROLE Team Leader

PERIOD 1 month / 2024.01 - 2024.02

TOOL Figma & illustration, PowerPoint

Concept

Designed an accessible healthcare service for vulnerable users, including older adults living alone.
The experience remains simple for users while generative AI and optimization algorithms work behind the scenes to support a more personalized and efficient service.

Key concept

Designed around immediate access
so users can find information as soon as they enter the service.

Intuitive **Simple** **Light**

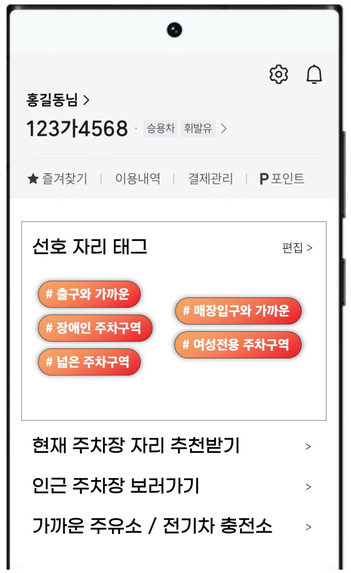

Project 03

Speed Parking

작동 과정

선호하는 자리를 미리 태그로 등록하면
맞춤형 AI가 이러한 특성을 가진 자리를
우선적으로 배정할 수 있도록
자리 선택 알고리즘에 반영합니다.

ROLE Team Leader

PERIOD 1 month / 2024.01 - 2024.02

TOOL Figma & illustration, PowerPoint, JavaScript

Concept

We approached the difficulty of finding available parking from the driver's perspective.
The concept combines an AI-based preference matching algorithm with real-time parking guidance to recommend a suitable space and guide the user to it.

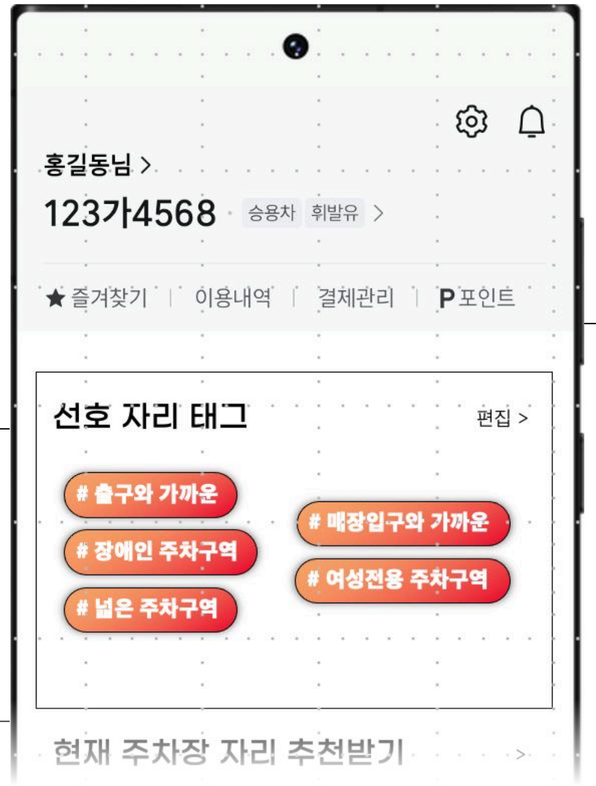

Key concept

Designed around visual content
so users can find information through a direct and concise interface.

App design

Lessons from Failure

Not every product decision, interface, or implementation went as planned. These failures were painful, but they exposed gaps in my process and became valuable opportunities to improve. The following cases summarize what went wrong and how they reshaped the way I build.

2022 Ttota Subway Boarding Assistance System

Social Connection Program for Older Adults Living Alone

2024 - 2025

Account 5

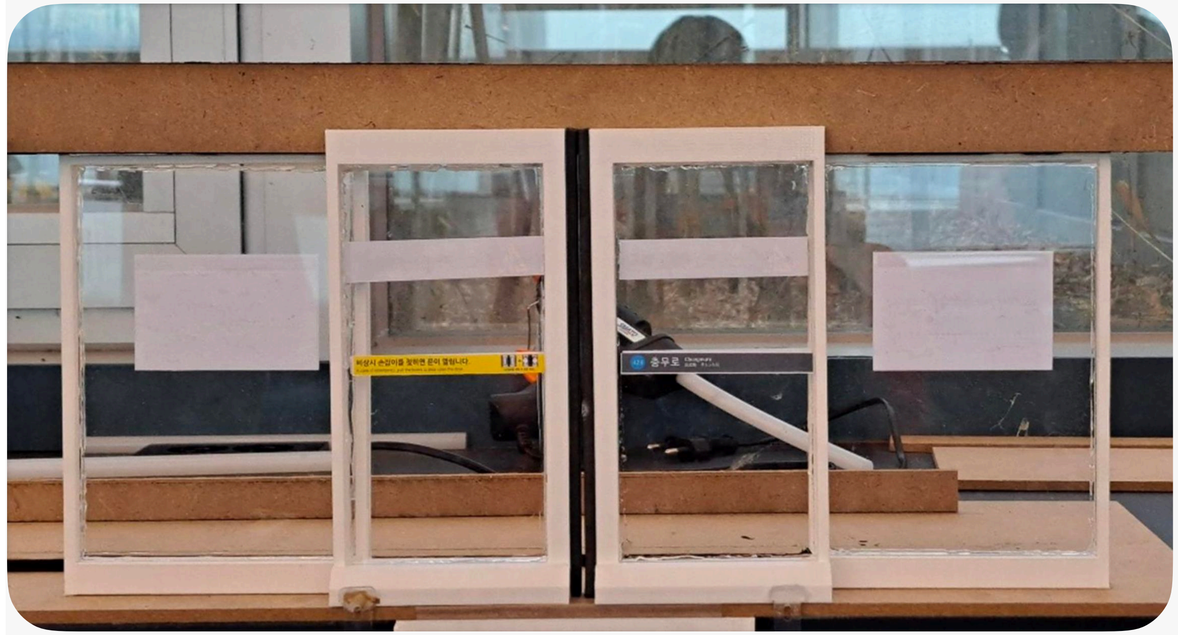

Focus UX UI

Ttota Subway Boarding Assistance

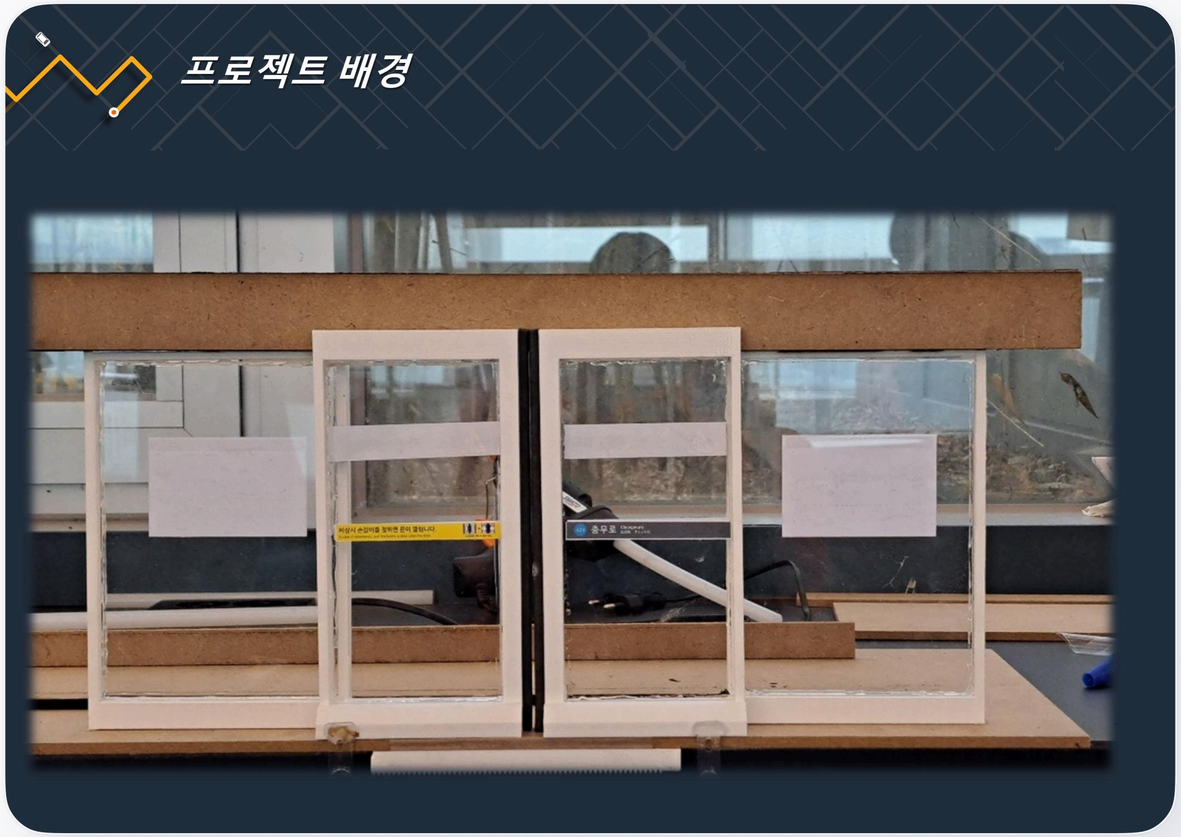

2022

Import **Hardware**

Contribution **90% +**

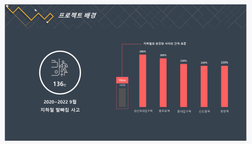

The Ttota Subway Boarding Assistance System deploys a safety platform to prevent gap-related boarding accidents and support passengers with reduced mobility. Because opening the platform for every train could disrupt peak-hour operations, we designed an additional mechanism that estimates boarding demand and activates the platform only when needed.

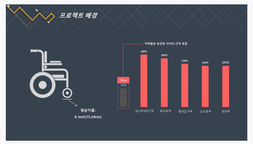

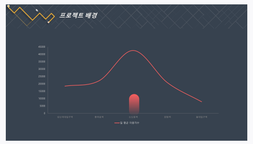

Why Error?

I focused on the implementation environment instead of validating the core function, which prevented us from finishing on time.
As team lead, I also assumed that I should handle every difficult task myself. Work that could have been completed faster through delegation was instead carried out inefficiently, and the intended functionality remained incomplete.
The organizers accepted a visible functional prototype, allowing us to achieve a positive result. However, the experience taught me to build the most important function first, delegate based on each member's strengths, and improve the product iteratively.

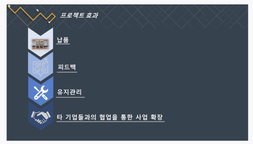

Lessons Learned

Although the organizers accepted the visible prototype, I learned that a stronger product starts with
the most important function and improves through short, repeated iterations.
Visual polish creates value only after the core experience works reliably.
Leadership does not mean taking every difficult task alone. It means trusting the team, assigning clear ownership,
and providing enough guidance for each member to contribute at their best.

Concept Suggestion

Project 05

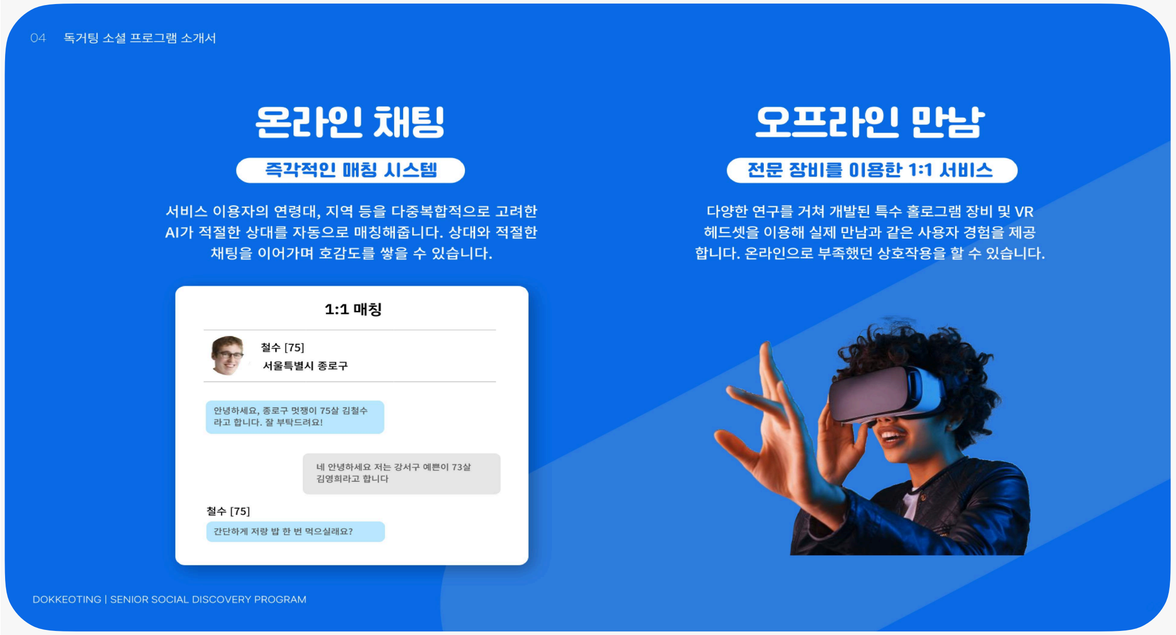

Social Connection Program for Older Adults Living Alone

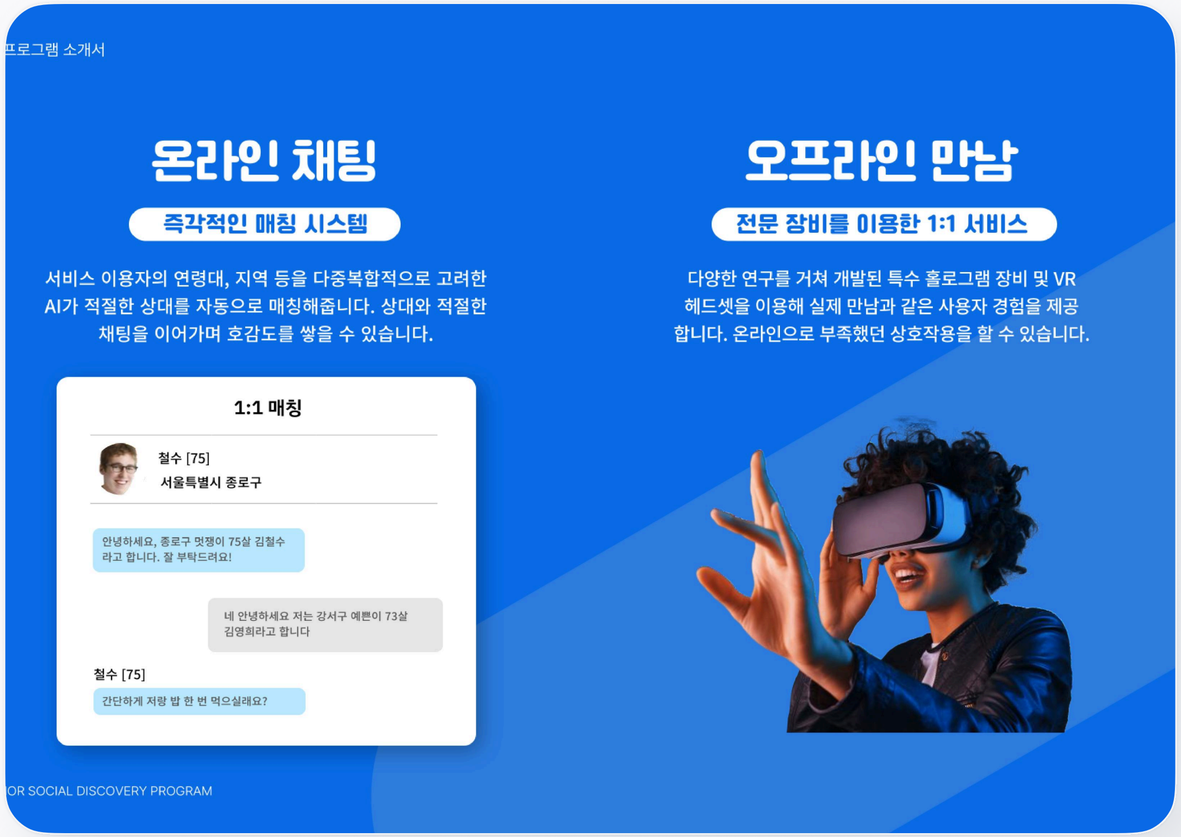

2022

Import **Service**

Contribution **80%**

Designed a social discovery service that helps older adults living alone find conversation partners and friends, reducing social isolation.
Because many users may be unfamiliar with digital services, the concept also includes offline experiences.

What Went Wrong?

With little time for team discussion, I rushed to define the concept before completing enough market research.

As a result, we could not clearly answer who needed the service, how strong the demand was, or how users would actually engage with it.

The pressure to produce a service kept our thinking in circles. We ended with only a broad outline rather than a product with the intended functionality, and the project received completion recognition but no award.

Lessons Learned

The experience taught me to study comparable services before implementation, identify the target user's real needs,
and define the product around evidence rather than assumptions.
References should guide the structure of the service, not be copied. They help the team reach a testable product direction faster.
Choosing one direction does not mean shutting down every alternative. The team should keep discussing other possibilities as new evidence appears.
Sustained exploration makes it more likely that useful and original ideas will emerge when the first approach reaches a limitation.

A Developer Who Validates Ideas and Turns Them into Working Products - Gibeom Ko

I start by understanding users and their environment, then test the riskiest technical assumptions first.
I connect SwiftUI, AI, BLE, and embedded systems to build MVPs with a complete End-to-End flow.
At JunctionX Korea, I will help the team turn an idea into a testable, working outcome within 48 hours.
